

## Full-Text Extraction

---

## Full-Text Extraction

Full-text extraction plug-ins extract full-text from digital files, such as image files and PDFs.

---

## Plug-in Parameters

Depending on the specific implementation, a plug-in may or may not require parameters. If the plug-in does require parameters, they are populated in the installation of a new instance of the plug-in.

---

## Usage

A Full-Text Extractor plug-in can be used by the **Extract Full Text** task to extract full text from a file and store it in Rosetta. The full-text can then be exposed to other systems such as OPAC with the **Full Text Viewer Pre-Processor** plug-in to provide enhanced search capabilities. The full-text can be deleted using the **Delete Full Text** task.
