

Browse call numbers is not bringing up the expected results

Symptoms

When we browse for Library of Congress call numbers/classifications, the results list shows first all headings from 050 \$\$a.

The combined values from 050 \$\$a and 050 \$\$b are listed at the end of the list.

Defect Status

This is a known issue and will be fixed in the future.

Replication Steps

Browse Bibliographic Headings for Call Number/Classifications with source code = Library of Congress Call Number.

Search for a value combined from 050 \$\$a and 050 \$\$b, e.g. \$\$a HG406 \$\$b .R678 > HG4026 .R678

The results list will first display headings including both values in 050 \$\$a = HG406.R678

The combined headings from both subfields will be listed at the end.

Workaround

You can use the double-dagger sign (‡) as a separator if the search value is from different subfields.

Example: HG4026‡.R678
