

## Using CZ provided Thumbnails in Primo VE

### Thumbnails links in CZ records

Primo thumbnails are provided from several predefined sources, such as Syndetics Unbound, Google Scholar, Alma-D and more, as described [here](#).

For some Community Zone providers, thumbnails are not available through these sources. To support displaying thumbnails for such titles in Primo, a new thumbnail source based on Community Zone (CZ) records is being introduced.

Thumbnails provided by content providers to CZ records are stored as full URLs in the local field **957 \$u**, and will include its source.

**Example:** 957 \$z Cover Image \$u <https://www.kanopy.com/node/14143141/external-image> \$x Kanopy.

### Primo Configuration

To display these thumbnails in Primo, you will need to add a Thumbnail Template in:

**Configuration Menu > Discovery > Display Configuration > Thumbnail Configuration**

Configuration details are described [here](#).

Use the following settings:

- **Template name:** e.g. *Thumbnails from CZ*
- **Field:** 957
- **Subfield:** u
- **Use field:** Always (unless you want to use only for specific URLs)
- **Normalization:** No Normalization
- **Template:** \$\$LinkingParameter1

After configuration, records from providers that supply thumbnail links to CZ records will display these thumbnails in Primo.
