

Does new Voyager location impact Primo Extracts?

- **Product:** Voyager
 - **Product Version:** 8.0.0
-

Question

A new location code has been added to SysAdmin. Does this affect the extracts for Primo?

Answer

- If the location is OPAC suppressed, there is no change to the Primo extract.
- If new location code will be viewed in Primo, the code must be added to the Primo extracts config files only if the [LocationCodesForBibInclusion] in PrimoExp*.ini files are NOT blank. If the stanzas are blank, no changes are needed.

How to check the PrimoExp*.ini files

1. In m1/voyager/xxxdb/ini, find the most recent PrimoExp-*.ini files. There will be files for PrimoExp-Selective.ini and PrimoExp-Publishing.ini. (A consortia would have multiple versions of these files to be checked.)
 2. `more PrimoExp-Publishing.ini`
 3. Look for the stanzas [LocationCodesForBibInclusion] and [LocationCodesForAVA]
 - a. If these stanzas are blank, no change is required.
 - b. If these stanzas have locations codes AND the new code should appear in Primo
 4. Create an archive of the current version of the *.ini
 5. Add the new code to both stanzas and a comment to the top of the ini documenting the change.
 6. Save the changes.
 7. Make the same changes to PrimoExp-Selective.ini.
 8. Go to /m1/voyager/xxxdb/tomcat/vxws/ini/PrimoExp.ini. This file controls returned values for RTA.
 9. Look for the stanzas [LocationCodesForBibInclusion] and [LocationCodesForAVA]
 10. If these stanzas are blank, no change is required.
 11. If these stanzas are not blank, make the same changes as documented in steps 4-6.
