Question

How can I tell if jboss is running?

Answer

[Note: in v22 Apache Tomcat is used instead of jboss, but all of the commands below remain the same.]

Either of these commands should return content with "jboss" in it if jboss is running:

```
>> ps -ef | grep jboss  
>> ps -ef | grep "/a._1/product/local/java/bin/java"
```

* Try to telnet to the jboss port:

```
>> telnet localhost 1891
```

* Check if the jboss log is being updated:

```
>> jlog  
>> tail -f server.log
```

* To check if jboss is answering use this command:

```
>> wget http://localhost:1891/rest-dlf/test
```

It creates a file named test that contains the jboss answer.

Additional Information

If JBoss is running on the wrong port, consult Article [rest-dlf connecting on 1892 rather than 1891](#) for how to change it.
