Question

What is the Z65 Oracle Table?

Answer

*The z65 is the GUI session table.

*It resides in the vir01 library and is similar to the z63 www_server session table.

*A z65 record is created whenever a pc connects to the pc_server. The z65 contains a z65_time, which is updated when the user presses Enter.

*The z65 is considered expired and is no longer counted as an active GUI session when the z65_time is more than 10 minutes old.

*But the z65 remains (in case the user reconnects); z65 records are deleted by the clear_vir01 procedure.

The following are Z65-TYPE's: PC-SERVER, Z39-SERVER, OC-SERVER (oclc_server)
