## Control of PST subfields displaying in Web

- **Article Type:** General
  - **Product:** Aleph
  - **Product Version:** 20
- 

### Description:

How can we control the subfields which display for the PST field in the Web Full, GUI Full, Web Brief, or GUI Brief?

### Resolution:

As described in the "How To Change Bib Info Displays" document, what fields display in the Web (or GUI) Full is controlled by the field's entry in the `./xxx01/tab/edit_doc_999.eng`. (The ones with "W" at the end of the line are for Web Full; the ones with "G", for GUI.)

What subfields from that field display (whether PST or any other field) is controlled by the `edit_field` ID (column 6) in `edit_doc_999`. The PST needs to have an "L" in this column to be linkable.

So then it's the `edit_field: 1 L PST.. L ..` line which controls which subfields from the PST are included.

For the Web Brief, it's column 8 in the `./xxx01/tab/www_tab_short.eng` which specifies the `edit_field` ID. For the PST, it should be "L".

For the GUI Brief, the `edit_field` ID "S" is automatically used, so it's the `1 L PST.. S ..` entry in `edit_field.eng` which controls the display (when PST is included in the `pc_tab_short.eng` table).
