## How do I encrypt client-to-server traffic?

- **Product:** Voyager
- 

### Question

How do I configure Voyager to encrypt communication between server and clients (such as Reporter)?

### Answer

The encryption setting needs to be configured in one or both of two places:

- In the [GlobalLog] stanza of the Voyager.ini on each PC, change the encryption line to "Encrypt=Y". This will only affect clients on this PC.
  - In the voyager.ini file on the Voyager server (/m1/voyager/xxxdb/ini), go to the [voyager] stanza, and change the encryption line to "Encrypt=Y". This will affect all clients connecting to the server.
