
From" value in GUI-generated emails

- **Article Type:** General
- **Product:** Aleph
- **Product Version:** 20, 21, 22, 23

Desired Outcome Goal:

Correct "From" value in GUI-generated email notices.

Procedure:

There are two components to the "From:" the name and the <email address> which must be specified on the PC which is producing the notices (the PC the Print Daemon is running on).

1. To set the name, specify a "MailerName=" value in the [Mail] section of the PC's .\alephcom.ini.
2. To set the email address, specify a "FromAddress=" value in the [Mail] section of the PC's .\alephcom.ini.

Additional Information

Example....

Instead of:

From: XXX Biosciences Library/Circulation Department <bioscilib@xxx.edu>

site wants:

From: XXX Library/Circulation Department <library@xxx.edu>

.\alephcomj\tab\alephcom.ini [Mail] on PC needs to have:

MailerName=XXX Library/Circulation Department

FromAddress=library@xxx.edu

To test the "From:" value of the email, conduct the test described in Article " [How to define GUI to send email](#) "

.
