
"No template exists named patron-address-direct" (in general)

- **Article Type:** General
 - **Product:** Aleph
 - **Product Version:** 21
-

Problem Symptoms:

An "XML/XSL errors" message appears when attempting to print reports, for example, the loan-report or cash-summary report.

This is the detailed error message:

```
Error at xsl:call-template on line 253 of file:/C:/AL500-21/alephcom/files/ASH50/PrintTemplates/eng/funcs-misc.xsl:  
No template exists named patron-address-direct  
Transformation failed: Failed to compile stylesheet. 1 error detected.
```

Cause:

If the /C:/AL500-21/alephcom/files/xxx50/PrintTemplates/eng/funcs-misc.xsl (on the PC) contains a call-template name="patron-address-direct" reference, then the funcs-address.xml in this same directory needs to include the line:

```
<xsl:template name="patron-address-direct">
```

Resolution:

1. Replace the xxx01 (or xxx50*) ./form_eng/funcs-address.xml with the ./usm01/form_eng/funcs-address.xml (which includes the "patron-address-direct" reference -- which the original version of funcs-address.xml in the xxx50 form_eng did not).
2. Run util i/6 to recreate the html.pck.
3. Restart the GUI client.

* If the xxx50 path_convert file lacks a redirect to the xxx01 form_eng, then the xxx50 form_eng is the active directory.

Additional Information

This was an intermediate step in the diagnosis.... In the C:/AL500-21/alephcom/files/xxx50/PrintTemplates/eng/funcs-address.xml on your PC, change the:

```
xsl:call-template name="patron-address-direct"
```

to:

```
xsl:call-template name="patron-address"
```

(don't restart the client) and try running one of the problem reports.

This worked, but since we couldn't find a way to prevent the funcs-misc.xml generated on the PC from including "patron-

address-direct" -- even when the ./form_eng/funcs-misc.xsl did not! --, this changed version would be overwritten every time a new html.pck was imported from the server. Thus, we implemented the solution described above.
