## PPR: EVENT.EVENT\_XML gives error when called

- **Product:** Voyager
  - **Product Version:** 9
- 

### Problem Symptoms

- Accessing EVENT.EVENT\_XML in Microsoft Access gives error: ODBC--call failed. [Microsoft][ODBC Driver Manager] Function sequence error (#0)
- Table data displays with #NAME? for all values.

### Cause

This is an issue with MS Access which cannot handle columns with data type BLOB or CLOB. This data type applies to a handful of fields in the Voyager database, including EVENT.EVENT\_XML.

### Resolution

Omit fields with data type BLOB or CLOB from MS Access queries.

### Additional Information

#### Replication steps

1. Install ODBC drivers & link tables for Voyager 9.0.0 Prepackaged Reports
2. Under Tables, open EVENT table.
3. Receive error: ODBC--call failed. [Microsoft][ODBC Driver Manager] Function sequence error (#0)
4. Click OK.
5. Table data displays with #NAME? for all values.

### Workaround

Create query with all fields from EVENT table except EVENT\_XML. Save query and use query instead of EVENT table for custom queries.
