

## Catjobs run against entire database after regen

- **Article Type:** General
  - **Product:** Voyager
  - **Product Version:** 8.1.1
- 

### Problem Symptoms

- Recently had headings regen
- When running Pcatjob -j1 -j2 -j3 -j6 and -j7, jobs run against entire database and ignore date parameters

### Cause

Headings regen resets the dates on all headings when running after a successful regen, also part of a Voyager software upgrade.

### Resolution

Run catjobs immediately before and immediately after regen to evaluate headings before and after regen. Also consider changing the date parameters to capture data starting the day after the regen to start collecting the changed headings since that regen.

### Additional Information

See Reporter User's Guide, p. 2-17, "The Cataloging batch jobs" for more information.
