
Library information in OPAC is not displayed

- **Article Type:** General
- **Product:** Aleph
- **Product Version:** 21

Problem Symptoms:

When clicking the icon "Library information" for a record in Opac the library information is not displayed but only a screen that says that the information can't be displayed. The created link is missing the information for the Sublibrary.

Example for a link to library information:

http://nnn?func=library?_library=

Cause:

Configuration

Resolution:

For the creation of the link the sublibrary is expected to be in field LOC\$b, this is hardcoded.

Subfield " " for field LOC is missing in configuration table xxx01/tab/expand_doc_bib_z30_loc which is used for creating the LOC field and therefore "&sub_library" in the link can't be filled.

Add the following line to xxx01/tab/expand_doc_bib_z30_loc and restart the WEB server afterwards:

```
# z30-sub-library b space N
```

Category: Web OPAC (500)
