

Unbalanced status of Index instances

- **Article Type:** General
 - **Product:** Rosetta
-

Problem Symptoms:

When going to Home > Advanced Configuration > Repository > Index Status, a server which role is defined as IDX, contains 1 or very low number of Index size (Files)

Cause:

This may be caused by a wrong definition of the `idx.server` parameter in the `global.properties` file.

Resolution:

The `idx.server` parameter should have its server name as its parameter.

For example, if there are 2 servers which are defined as indexers named: `server1` & `server2`, the `idx.server` parameter on `server1` should be `idx.server=server1`, and the `idx.server` parameter on `server2` should be `idx.server=server2`
