Question

In order to use current ALEPH18 server as ALEPH21 test server: does aleph21 need to be installed first -- and then the utree and oracle data copied to it?

Answer

Yes, Aleph 21 needs to be installed first (using the AIK) and the utree and Oracle data then copied to it.

This copy of the utree and the Oracle data from Production to Test could be done with the Upgrade Express kit:

- * Export Customer Data on Prod and then
- * Install Customer data on Test

-- ignoring the other Upgrade Express steps.
