Question

Is it possible to run "Check Input File Against Database (manage-36)" to match against records using more than one element in the record, e.g. at least 2 fields must be identical to find a match?

Answer

The match table is designed to bring docs that match with at least one criterium, not with all the criteria. A workaround could maybe be to run several times "Check Input File Against Database (manage-36)", each with one of the criteria, using the "exact match" output as input for the next one.
