## What goes in voyager.ini file?

- **Article Type:** Q&A
  - **Product:** Voyager
  - **Product Version:** 8.2.2
- 

### Question

I installed the Voyager clients for the first time; what values should be updated?

### Answer

Each Voyager client has its own stanza in the voyager.ini file. Within each stanza are 3 values:

Server=	This is the IP address or hostname of your Voyager server. This value will be the same for every stanza.
Port=	This is the server port the client uses to communicate with the Voyager server. See <a href="#">Network Ports used by Voyager</a>
Timeout=	This is the value, in seconds, for <a href="#">client communication timeouts</a> . It is set to 60 by default.

If you install new clients after upgrade, you may need to update the Server= and Port= values to reflect the IP and port series for your Voyager server and database instance.

### Additional Information

Some additional stanzas in the file include

[GlobalLog]	Contains additional variables, such as those to enable single login and client encryption (must also be enabled on the server)
[E-mail]	This stanza is used if you send email notices with Reporter.
[Upgrade]	This stanza is used if you employ AutoUpdate (for Voyager 8.0.0 and higher; see Technical User's Guide)
