
How do I format deep linking to Tomcat WebVoyage?

- **Product:** Voyager
 - **Product Version:** 7.0.1
-

Question

How to correctly format deep links from another interface (i.e., FirstSearch) into WebVoyage?

Answer

A number of formats will work to link into Tomcat; this format is one example:

1. Identify your WebVoyage URL.
2. Identify the search code you wish to link to. This code should match a search code in System Administration.
3. **Format the link with this information:** `http://<url>/vwebv/
search?searchCode=<code>&searchType=1&page.search.search.button=Search&searchArg=`

Additional Information

Example:

1. **WebVoyage URL =**
`http://my.library.edu`
2. Search code used for ISBN: ISB3
3. **Resulting URL:**
`http://my.library.edu/vwebv/
search?searchCode=ISB3&searchType=1&page.search.search.button=Search&searchArg=`

You can choose your indexes for ISBN, ISSN and OCLC and create those URLs accordingly. A list of available Voyager indexes is available in the [System Administration User's Guide](#), Appendix A, and these indexes can also be viewed in the System Administration client in the Search tab.
