## JBOSS port and protocol

- **Article Type:** General
  - **Product:** Aleph
  - **Product Version:** 20
- 

### Description:

We want to configure our firewall on Aleph server for Primo-Aleph interoperability and need to know which port and which protocol JBOSS (used in OvP) is using.

### Resolution:

JBOSS is using protocol TCP (HTTP).

The server is running on port defined in parameter `http.port` of `global.properties`.

Example (port 1895 is used):

```
>> cd $alephe_root/jboss_conf
>> cat global.properties
server.name=localhost
http.port=1895
[...]
```
