Question

It is possible to define more than one ldap-Server in ldap.conf (the aim is to check the authentication on several LDAP servers)? If yes how should this be done?

Answer

You can define more than one ldap_<server>.conf and then in the tab_services file to determine the order of them, for example:

For example:

```
[AUTHENTICATE]
program = ldap.pl
params = ldap_a.conf
program = ldap.pl
params = ldap_b.conf
[END]
```
