Question

When sending mails from the Opac the incoming mail contains no information. When saving records from the Opac there is no problem. Why?

Answer

The problem lies within the \$alephe_tab/send_mail file which was self customized on customer's server.

You can either:

1. Remove the local send_mail script and use the standard send_mail or no send_mail script.
2. Debug your self customized send_mail script
