## Extract bibliographic data from a specific sub-library to COPAC

- **Article Type:** General
  - **Product:** Aleph
  - **Product Version:** 22
- 

### Desired Outcome Goal:

Extract from a specific sub-library ABC bibliographic and holdings data to export it to a UK union catalogue called COPAC <http://copac.ac.uk/>

### Procedure:

- 1) In CATALOG GUI call up service "Retrieve Records Using CCL (ret-03)" and use "Command Language Phrase" = "wsl = ( abc )". Choose a name for the output file (e.g. "outputret03")
- 2) When the service has finished call up service "Download Machine-Readable Records (print-03)".  
User your output file from ret-03 (e.g. "outputret03") as input file now.  
Choose a name for the output file (e.g. "outputprint03").  
Enter "ALL" for Field 1.
- 3) Provide the output file of print\_03 to COPAC.

---

## Additional Information

From the COPAC homepage <http://copac.ac.uk/librarians/contributing/> we understand that COPAC is able to load data in MARC XML but even in „Aleph sequential format“. So you need to provide to COPAC an output file of p\_print\_03.

From your configuration files in ./xxx01/tab we see that you have setup a sub-library word index called WSL.
