
Secure SMTP in Aleph 20

- **Article Type:** Q&A
 - **Product:** Aleph
 - **Product Version:** 20
-

Question

Is it possible to setup Secure SMTP in Aleph 18?
Are there any changes in Aleph 20 for the setup?

Answer

Yes, since Aleph 18, rep_change 1794 you can use the option to use a secure SMTP server for sending e-mails from the Aleph GUI client.

Aleph 18

* In order to use this function add the following lines to `.\alephcom\tab\alephcom.ini`:

```
[Mail]
```

```
UseSecureSMTP=Y
```

Changes in Aleph 20

* The above line is redundant. You may remove this line.

The AlephADM menu option for entering a mail server is always available.

* Options in the `.\alephcom\tab\alephcom.ini`:

```
[Mail]
```

```
AuthMethod=LOGIN
```

```
MailServer=MAIL.ORGANIZATION.COM:45
```

AuthMethod options: LOGIN or PLAIN.

If you do not use secure SMTP, enter nothing.

* For non-standard port enter the port number after the name of the mail server, separated by a colon.

* To use a password for the SMTP server:

- go to AlephADM module

- edit the e-mail settings in the "Configuration" menu.

* MailOptionsDlg moved from `.\alephadm\tab\[Ing]window.dat` to `.\alephcom\tab\[Ing]window.dat`.

Additional Information

See also document "How to from support" / "GUI_email_and_installation" / "The_use_of_a_secure_SMTP_server.ppt" which shows how to configure the SecureSMTP in Aleph 18. The document does not include changes in Aleph 20!
