
print.ini Function Names and XSL File Names

- **Article Type:** Q&A
 - **Product:** Aleph
 - **Product Version:** 18 and up
-

Question

Where to find the connection between the XSL filename and the name in the print.ini?

Answer

A spreadsheet containing all the known function names can be found here [print-function-names.xls](#)

Additional Information

See also article [How to Print Notices to Patrons to Both the Printer and Email](#). It discusses how to use a function name even if one doesn't exist.

It is a common misconception that print.ini job names can also be used by Services. The lines in print.ini are ONLY for use with "on-demand" printing, not with printing from the Services menu. "On-demand" printing refers to letters and forms that are printed from the GUI either as automatic responses to some action or by clicking a Print button. Services menu jobs such as acq-14 and cir-52 do not have job names in print.ini.
