

Running other batch jobs while running indexing jobs

- **Article Type:** General

Description:

If we want to re-run all indexes during the weekend, can we still have notices being run during that re-index? Or do you recommend shutting down the job list?

Resolution:

You definitely need to prevent backup jobs from running. clear_vir01 might also be a problem.

If you are talking about bib indexing -- not ADM indexing (p_acq_04, p_manage_z111, p_cir_25) --, then notice jobs should be OK.

Note: some jobs read the z13, which is rebuilt by the p_manage_07 job, to get author/title information.

I think it's safer to stop the job_daemon (util e/15/2) while indexing jobs are running -- and then restart it when they are done.
