Description:

What values can be used for the Procedure to Run in p_manage_17?

In one place it says it should always be "C" for continue from last run, but I seem to remember other options for running it after a p_manage_02.

Resolution:

Originally it was intended that an option "A" could be used (which would be faster), but, as described in different Knowledge Base records (5924, 5940), this caused some bad problems.

p_manage_17 has been changed to issue the following message when "A" is specified: "Error: Option A unavailable until further notice, Exiting".

Therefore, p_manage_17 must always be run with option "C".
