
How to set up Words in the xxx60 HOL library

- **Article Type:** General
 - **Product:** Aleph
 - **Product Version:** 20
-

Description:

We want to be able to do Word searching of our abc60 HOL records. I know we need to run p_manage_01. Is there anything else we need to do?

Resolution:

The usm60 is not set up for the Word indexes since most sites don't build the Words there.

You will need to populate the tab00.eng and tab11_word files with the indexes you want to build; copy the WORD entries from your xxx01 tab_expand to the xxx60 tab_expand; and. copy your xxx01 tab_word_breaking to xxx60.

Your xxx60 z52 (util g/2), probably copied from usm60, probably lacks the last-word-number parameter. You need to add it. See KB 16384-39761.

Also, though the ./aleph/tab/file_list.HOL contains entries for the z95, z97, and z98 tables, it lacks entries for the z970 and z980. You will need to place entries like the following in your ./xxx60/file_list:

```
TAB z970 100K 0K TS1D
IND z970_id 100K 0K TS1X
IND z970_id1 100k 0K TS1X
TAB z980 1M 0K TS3D
IND z980_id 1M 0K TS3X
```

and then do util a/17/1 for the z970 and z980 to create these tables before running p_manage_01.

KB 16384-47490 is a related record describing a specific set-up of the xxx60 Words.
