
Should we specify "secure_ldap = Y" in our ldap.conf?

- **Article Type:** General
- **Product:** Aleph
- **Product Version:** 19.01

Description:

Users connect to our OPAC with SSL (<https://...>). Does this mean that we should specify "secure_ldap = Y" in our ldap.conf? (Note: the ldap server we are connecting to does *not* use SSL.)

Resolution:

If the ldap server you are connecting to does not use SSL, then you would have "secure_ldap = N" -- or omit this line since "N" is the default.
