

When to run the create_z127 script

- **Article Type:** General
 - **Product:** Aleph
 - **Product Version:** 20
-

Description:

In the post upgrade instructions for course reserve, it calls for the following command to be run `csch -f $aleph_proc/create_z127`

Does this only have to be run once, or does it have to be run for each xxx30 library. If for each, how do I run it so that it is associated with a given library -- since it doesn't show the library as a parameter in the job run.

Resolution:

`create_z127` needs to be run for each library, following `p_union_01/p_union_02` for that library.

The job runs for the library to which you are d-lib'ed.
