
Dealing with UE warning & error messages for XSL files

- **Article Type:** General
 - **Product:** Aleph
 - **Product Version:** 20
-

Description:

The UE for 19.01 to 20.01 log does not provide details about changes made in files-

Step 17 - Description:

Changed the following XSL files in all libraries:

```
./[all_libs]/form_{lng}/funcs-misc.xml  
./[all_libs]/form_{lng}/funcs-address.xml
```

```
*****
```

Step begin 17

A_WARNING: the file /exlibris/aleph/u20_1/abc01/form_eng/funcs-misc.xml has been already upgraded.

A_ERROR: the file /exlibris/aleph/u20_1/abc01/form_eng/funcs-address.xml differs from the original version. The file can not be upgraded automatically. Merge manually!

Step end 17

What changes need to made?

Resolution:

In /upgrade_express_1901_2001/conf/eng/17 there are four files:

```
funcs-address.xml  
funcs-address.xml.orig  
funcs-misc.xml  
funcs-misc.xml.orig
```

The files *.xml.orig are what was distributed with version 19 and *.xml are the new generic files for version 20. In your case at some point abc01/form_eng/funcs-misc.xml was upgraded, most likely with a service pack in version 18 or 19, so you already have the necessary changes in that file.

The funcs-address.xml in your abc01/form_eng is not the same as the funcs-address.xml.orig in the above directory so the error message is written to the log. All you have to do is compare the two funcs-address.xml files in the above directory using the command:

```
diff funcs-address.xml funcs-address.xml.orig
```

and you'll see the change/changes that you need to make in abc01/form_eng/funcs-address.xml. There is only one and it is to add the template patron-address-direct.

You may want to also use the diff command on funcs-address.xml.orig and abc01/form_eng/funcs-address.xml to see why yours differs from the original. It may be a change that was necessary in the past that you now want to remove.

In general all the new or to be changed files are stored in /upgrade_express_1901_2001/conf/{lng}/{step number}. Thus in your case /upgrade_express_1901_2001/conf/eng/17. You can check the directory for what is expected *.orig and what is being changed to or added (the files without .orig extension).
