
OPAC via Primo - Which Aleph ID Signs into Primo?

- **Article Type:** General
 - **Product:** Aleph
 - **Product Version:** 20
-

Description:

Which Aleph ID logs into Primo?

Resolution:

The restful API -- DLF -- works only with the Patron's true ID (i.e., the value of the z308_ID). This is the reason that it is limited to 12 characters:

```
Z308_REC_KEY NOT NULL CHAR(27)
Z308_VERIFICATION VARCHAR2(40)
Z308_VERIFICATION_TYPE CHAR(2)
Z308_ID CHAR(12)
Z308_STATUS CHAR(2)
Z308_ENCRYPTION CHAR(1)
```

If you're using LDAP authentication, the z308_verification_type has to be "02".

See also "How to Configure Aleph - Primo Interoperability" for the setup instructions.

Additional Information

opac, primo, ID
