
changes not taking effect after editing a .pm file

- **Article Type:** General
 - **Product:** SFX
 - **Product Version:** 3
-

Description:

After editing / localizing/ customizing a perl module (.pm file) or parser, my expected changes are not taking effect

Resolution:

In SFX version 3, apache needs to be restarted for the instance whose user has made any changes in a perl module (.pm file), in order for the changes to take effect. After saving and quitting the file, when returned to the user prompt, simply type: `apachectl restart` . The restart should take less than one second. Alternately, you can restart the instance apache using our `server_admin_util` tool, using option 1 - Stop/Start Services and then Option 8 - instance apache restart.
