## p\_acq\_31: does it aggregate the encumbrance for serials?

- **Article Type:** General
  - **Product:** Aleph
  - **Product Version:** 18.01
- 

### Description:

For orders with divided encumbrances between budgets, does p-acq-31 work the same for both monograph and serials? I have tested the monograph side and see how it aggregates the total encumbrance to the new fund. I need to know if this is the same for serials.

### Resolution:

Looking at the b\_acq\_31\_a program, I find that the section of code where the z601\_original\_sum's and z601\_active\_sum's are totaled is common to both the monograph and the serial/standing order encumbrances, so it seems that it does do the aggregation for the latter as well.
