

## p-print-11 runtime

- **Article Type:** General
  - **Product:** Aleph
  - **Product Version:** 18.01
- 

### Description:

The p-print-11 is incredibly slow! Is that to be expected?  
We are processing a file with 7952 lines starting at 9:46am.  
It is now 11:29am and the log is at the url from line 2151.

### Resolution:

When p-print-11 is running, it doesn't lock the usm01 library so users can still connect to the usm01 in the GUI/Web which competes with the p-print-11 job for server processing. Therefore this process is subject to concurrent network traffic and system use. It's recommended to run this process when the library is closed (and network/server traffic is slower).
