
p_course_06: human-readable version of output

- **Article Type:** General
- **Product:** Aleph
- **Product Version:** 16.02

Description:

I've been trying to generate a human readable version of the output generated by course-06. (a list of courses, arranged by instructor name and a list of bibliographic records for each course, arranged by course number).

I'm noticing that this function dumps the data into an xml file in the print directory of mbb30. Is there a function that can parse this xml and generate a flat file for printing?

Resolution:

The `./abc30/print/course-06_test` file is in xml format. It can be printed as regular text using the GUI print-daemon -- just as you would print the overdue notices (which --as you look at them in the `./abc50/print/` directory-- are likewise in xml).
