
Changing indicators as part of Generic Fix Doc Script

Description:

In doing p_file_08 (fix_doc_do_file_08) as part of p_print_03, I'm having problems changing the field to 099 where I need the call number to be.

It comes in as LOC1 or LOC8, for example, when I do a CHANGE-FIELD to 099 it ends up as 0991 or 0998. How do I get it to be just 099?

Resolution:

p_file_08 has a "CHANGE-FIRST-IND" operator which can be used to change the first indicator.

You can see examples of its use by doing:

```
> dlib usm01
> dt
> cd import
> view mrcv-perm8.fix
```

I believe you would do this to change the LOC first indicator to blank in every case:

```
1 LOC## CHANGE-FIRST-IND #,
```
