Desired Outcome Goal:

How can we evaluate records that are copied from an external Z39.50 base using CTRL+N

Procedure:

When copying a record from an external Z39.base using CTRL+N field SID [Source Id] is created in the local record. Field contains \$\$aZ39 \$\$bName of external base. For counting records which were copied from an external base use "Retrieve Catalog Records (ret-01)" and search for content of field SID.

Category: Z39.50 (500)
