

## aleph and apache not started after reboot

- **Article Type:** General
  - **Product:** Aleph
  - **Product Version:** 17.01
- 

### Description:

An electrical problem caused the Production server to go down this weekend. After reboot, neither aleph nor apache was started.

### Resolution:

The /exlibris/startup/init.dat file had "N" in the first column of the lines for the Prod apache and aleph.

Changing this "N" to "Y" caused apache and aleph to start as part of the reboot.
