Question

Can one display the subfields of a specific field from “father” record in the order they appear in the “father” record in link field?

Answer

Instead of listing every single subfield set the hash sign # for all subfields. Then they appear in the order they are in “father” record.

Example:

Instead of ...

```
Xxx01/tab/edit_lkr_text
```

```
03 update_z103_mab_010 200 # a $1:^
```

```
04 update_z103_mab_010 200 # c $1:^
```

```
05 update_z103_mab_010 200 # b $1:^
```

... set

```
03 update_z103_mab_010 200 # # $1:^
```

Additional Information

Example is from MAB environment.
