

## Aleph X-Server explain operator not working

- **Article Type:** General
  - **Product:** Aleph
  - **Product Version:** 17.01
- 

### Description:

We cannot use the "op=explain" url in a web browser to get a list of bases and index codes, or x-server commands.

### Resolution:

The problem that you were experiencing was due to a wrong path being used for the explain files. I added a line to the path\_convert file (saving a copy of the old) in the abc50 \$data\_tab directory to redirect the path from there to the \$alephe\_root/www\_x\_eng directory. As it turned out, there were no files there, either, so I copied one file from \$aleph\_root/www\_x\_eng (the file "explain-list") to the \$alephe\_root/www\_x\_eng directory and now it appears when you do this X-Server request:

<http://mysvr.univ.edu:4505/X?op=explain&file=list>
