
Print templates not transferring to GUI/PC -- ^M line feed characters

Description:

We made changes to the hold-request-slip-00.xml. I then ran UTIL I/6.

The new form hold-request-slip-00.xml doesn't seem to load to PCs, and its absence is creating errors in CIRC. I manually copied the xml file to a CIRC PC and everything worked fine.

What's happening here? Why won't the packages load?

Resolution:

When I look at the hold-request-slip-00.xml lines within the html.pck which util i/6 generates, I see the following:

```
PKC_FILE_BEGIN hold-request-slip-00.xml
<xsl:stylesheet^M
xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="1.0">^M
<xsl:include href="funcs.xml"/>^M
<xsl:template match="/">^M
<xsl:call-template name="header"/>^M
^M
<etc.>
```

I think that these "^M" ASCII line-feed characters should *not* be included in the file. It seems that in placing this file on the server you did not specify that it was an ASCII file. As described in KB 16384-1537, you need to either re-ftp, specifying ASCII, or use the dos2unix command -- and then re-run util i/6.
