
MARCEXPOR: -mS suppressed not working with -rH (export holding/mfhd)

- **Article Type:** General
 - **Product:** Voyager
 - **Product Version:** 8.2.2
-

Description:

Issue 16384-17378

Module: marcelexport

Releases - Replicated on Voyager 5-8.1.0

Server Platforms affected: All

Loss of functionality from previous version or prior build: n/a

Expected Results:

The -mS parameter (export MARC records that have been suppressed) used in conjunction with the -rH (record type of MFHD) in marcelexport would export MFHDs that are suppressed.

Actual Results:

The -mS parameter (export MARC records that have been suppressed) used in conjunction with the -rH (record type of MFHD) in marcelexport does not export MFHDs that are suppressed.

Replication Steps:

From the /m1/voyager/xxxdb/sbin enter the command line

```
Pmarcelexport -rH -mS -today
```

Record Type: MFHD

Export Mode: Suppressed - Date Range

Export Target: today

Output File Name: /m1/voyager/voydb/rpt/marc.exp.20120126.0942

[S]uppress option good only for bibs

WORKAROUND: Run a MSAccess Report via the Prepackaged Reports and pull mfhd_ids that are suppressed. Export that file into a tab delimited text file with one mfhd_id per line. Then, marcelexport that file using the -mM parameter (MARC ID input file).

Resolution:

Fixed in Voyager 8.2.2.
