

Proxy is added to permission.dat automatically

Description:

If a "P" (proxy, "P" in column 3) line is deleted from `./pc_tab/catalog/permission.dat` table, we find that UTIL-M-7 puts it back in automatically. How can we eliminate this?

Resolution:

The `./util/um_07_d.cbl` program reads the z66 table and, if it finds that the user has a "Z66-CATALOG-PROXY" value, it will generate a "P" line in `permission.dat`, making the user a proxy there also..

So, you will need to go to the GUI Admin Permissions and change the user to *not* be a Proxy of this other user. (Of course, if you have multiple users who share the same `permission.dat` value, making one a proxy to another in the Admin Permissions will work just fine.) (Note that you don't need to actually add the "P" line to the `permission.dat`: as we have seen, the system will generate it for you.)
