## Re-indexing the Course Reserves database

- **Article Type:** General
  - **Product:** Aleph
  - **Product Version:** 20
- 

### Description:

If I need to re-index the Course Reserves database (ABC30) which processes would I run at Version 20 to do so?

### Resolution:

The only reason you might want/need to reindex the abc30 might be changes to the abc30 \$data\_tab tab00, tab11\_word, tab11\_acc, tab11\_ind, tab\_filing, or tab\_word\_breaking. In which case you would run the jobs relevant to the change you have made, e.g.,

```
for tab11_ind, p_manage_05;  
for tab11_word, p_manage_01;  
etc.
```

There is no need to do a complete reindexing. This is not recommended.

That being said, the "How To Run Index Jobs", section 2.4, has the "Typical job sequence for Course Reading library":

```
p_manage_05  
p_manage_02  
p_manage_17  
p_manage_01  
p_manage_07  
p_manage_27
```

With version 20, the following should be added (after p\_manage\_27):

```
p_union_01  
p_union_02  
util a/17/1 for xxx30 z127  
csh -f $aleph_proc/create_z127  
p_manage_12 (with "Delete all Links?" "No")
```
