## 20.1 util sp: view implementation notes: "Service pack not yet installed"

- **Article Type:** General
  - **Product:** Aleph
- 

### Description:

v20 was installed on our server in early November (after 20.1 was released).

We have run Upgrade Express and need to see the Implementation Notes for rep\_change's 1-2261, but when we do util sp:

### SP. Service Pack Management

-----

0. Exit Procedure
1. Prepare/Update Environment
2. Download latest SP
3. Check SP download completing
4. Install SP
5. Run SP Utility (view implementation notes)

and enter #5, we get:

Service pack not yet installed

The ver command shows:

```
aleph> ver  
SUN_OS_2, abc, Aleph 20.1.0 (2261) copy 1, 13-Feb-2009  
<etc.>
```

If we choose #4 (Install SP), we get:

```
installation utility detected  
Service Pack 2261.  
Binary SP file found for SunOS-new  
Options fast = N initial = N  
Error: Your Service Pack level is 2261. sp.utility not found. Exiting.
```

We see that there's a Download Center -> Service Packs -> 20.0 -> Aleph-20-Minor-Release-1.xls document on the Doc Portal, but that only talks about the two Mandatory rep\_change's.

How are we supposed to see the Implementation Notes for rep\_change's 1-2261?

### Resolution:

Minor Release 20.1 includes all of the rep\_change's up to the point of its release (1-171 and 2000-2261), but since it is not a Service Pack, the util sp -- view implementation notes does not work.

The Download Center -> Service Packs -> 20.0 -> Aleph-20-Minor-Release-1.xls spreadsheet has multiple worksheets. The sheet which displays initially is the Introduction -- with only the two Mandatory changes --, but there are tabs at the bottom for four additional sheets:

Enhancement Highlights

Rep\_change 2000-2261 (Minor)

Rep\_change 1-2261

Minor Release Guidelines
