## How to create an extra index for 2nd. call number?

- **Article Type:** General
- **Product:** Aleph
- **Product Version:** 20

---

### Desired Outcome Goal:

How to differentiate in two different indexes between 1st. and 2nd. call number? Where is the subfield for the call number in field LOC defined?

### Procedure:

A differentiation of 1st. and 2nd. Call number is not possible when using program `expand_doc_bib_loc_usm` in order to expand the information from item into BIB record as the subfields are hardcoded.

With program `expand_doc_bib_z30` it is possible to differentiate.

In file `xxx01/tab/expand_doc_bib_z30` you'll have the following lines:

```
# z30-call-no 3 space X  
# z30-call-no-2 9 space X
```

In `xxx01/tab/tab_expand` set  
WORD `expand_doc_bib_z30`

Add field `Z30###$3` and `Z30###$9` accordingly in indexing tables `xxx01/tab/tab11_word`

**Category:** Cataloging (500)

**Subject:** Create / Edit records (500)
