
Translation/Character Conversion of www_const file

- **Article Type:** General
 - **Product:** MetaLib
 - **Product Version:** 4
-

Description:

I tried to translate textual elements in the ./insNN/www_v_<lng>/menu-Ing HTML file to non-Latin characters using the ./insNN/tab/www_const.<lng> table.

The www_const.<lng> table has the relevant character conversion line on top of the table (CHARACTER_CONVERSION=8859_X_TO_UNICODE) but the display of the language menu still appears as Gibberish.

Resolution:

Some HTML files require adding the character conversion line:

```
<?xml version="1.0" encoding="UTF-8"?>
```

On the very top of the HTML file in order to display non-Latin characters correctly when these are translated either within the file itself or by using the www_const.<lng> table.

One of these files is menu-Ing.

Adding this line to the top of the menu-Ing HTML file causes the language menu to display the non-Latin characters correctly.
