

## How to tell if p\_manage\_17 has been run

- **Article Type:** General
  - **Product:** Aleph
  - **Product Version:** 17.01
- 

### Description:

We believe that p\_manage\_17 may not have been run at our site when p\_manage\_02 was run. How can we tell?

### Resolution:

You can tell whether p\_manage\_17 has been run by the value of the library's util g/2 last-long-acc-number. If it is close to the last-acc-number -- in the vicinity of the number of headings that existed at the time p\_manage\_02 was last run--, that indicates that p\_manage\_17 was run at that time. If the last-long-acc-number is 0, that indicates that p\_manage\_17 was not run.

Also, p\_manage\_17 orders the long headings (more than 69 characters). If p\_manage\_17 has not been run, staff and patrons will usually be complaining that these long headings are not in order.

Note: When run with option "C" (as it should be), p\_manage\_17 reads the last-long-acc-number to decide where to start. If it is your intention to run p\_manage\_17 for all headings, the last-long-acc-number needs to be 0.
