

Missing name for redirect

- **Article Type:** General
 - **Product:** Aleph
 - **Product Version:** 20
-

Description:

We get the message, "Missing name for redirect", in trying to run a script (an indexing "super-script"):

```
> csh -f $aleph_proc/p_manage_07 ABC01,1,000000000,999999999,16,0,00, > &  
$alephe_scratch/abc01_p_manage_07.log
```

Resolution:

Rather than being a single command, the first line had a carriage return, so the second line was being read as a separate statement.

The solution was to "join" the lines (SHIFT + J) so they became a single logical line.
