
CJK in HTMLPrint

- **Article Type:** General
 - **Product:** Aleph
 - **Product Version:** 16.02
-

Description:

The problem:

CJK characters are seen and printed in the GUI "Print Preview".

But in the HTMLPrint software - Blank squares are shown instead of the CJK characters.

See the attached Doc that explains How to print CJK characters in HTMLPrint.

Resolution:

The reason:

This is because the Style definitions (a CSS attribute in the HTML) for the "font-family" of the text.

For example: style="font-family=arial;

Possible solutions:

There are three possible solutions.

See the attached Doc that explains How to print CJK characters in HTMLPrint.

1 Install support East Asian languages in the PC.

Or:

2 - Remove the "font-family" style definitions from the relevant "funcs.xml" and all "funcs-*.xml" XSL's.

After this (+ doing util I 6 to re-package templates, and restarting the GUI), the HTML output will be generated without the style definition of the "font-family".

- Then you can define the appropriate font in the HTMLPrint.ini file for HEADER, FOOTER and BODY

For example:

```
[FOOTER]
FONTNAME=Arial
FONTSTYLE=
FONTSIZE=8
```

```
[HEADER]
FONTNAME=Tahoma
FONTSTYLE=
FONTSIZE=8
```

[FONT]
NAME= Arial Unicode MS
SIZE=10

Or:
3Define the appropriate font in the "font-family" style definitions in the "funcs" XSLs templates.
For example:

```
<TABLE WIDTH="100%" style="font-family=Arial Unicode MS; font-size=9pt">
```
